

Gantt Chart – What and when to collect samples for the Juvenile Dermatomyositis Cohort Biomarker Study and Repository [UK and Ireland]

* = It is useful to collect PBMC and serum when a patient has a flare.

** = As required along the time line. More DNA may be required and may be requested by the central laboratory team (i.e. if volume of blood not enough at 1st time point).

*** = After 1 year of data is collected, it is at the local PI and/or local team's discretion whether to use a form 2 **OR/AND** a form 3. This is usually dependent upon the frequency of the patients' visits. Please note that some centres might complete a form 2 every 3 months after initial diagnosis.

Serum 1ml (plain tube no anti coagulant)

DNA 3ml (EDTA tube)

PBMC minimum 5ml (heparin tubes from co-ordinating centre)
